## Implementation of TRIE Trees

**V R BADRI PRASAD**

Department of Computer Science & Engineering

### Structure of a node in a TRIE Tree :

- A node of a TRIE tree is represented as shown below.
- One field for each alphabet( A – Z), 26 columns.
- Each column is a pointer to another TRIE node or carries NULL and
- One field for end of word (key).

| A                   | B  | C  | D  | E  | F  | ..... | W   | X   | Y   | Z   |
|---------------------|----|----|----|----|----|-------|-----|-----|-----|-----|
| F1                  | F2 | F3 | F4 | F5 | F6 | ..... | F23 | F24 | F25 | F26 |
| End of Word / (eok) |    |    |    |    |    |       |     |     |     |     |

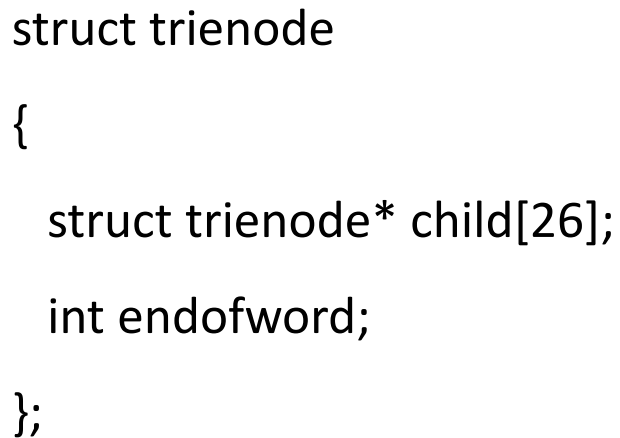

Address of the next node (reference for us)

Field number – for user's reference no field is created , No memory is allocated

End of word / key field

```
struct trienode
{
    struct trienode* child[26];
    int endofword;
};
```

## TRIE Trees – Implementation

|                          |    |    |    |    |    |       |     |     |     |     |                                             |
|--------------------------|----|----|----|----|----|-------|-----|-----|-----|-----|---------------------------------------------|
| A                        | B  | C  | D  | E  | F  | ..... | W   | X   | Y   | Z   | Address of the next node (reference for us) |
| F1                       | F2 | F3 | F4 | F5 | F6 | ..... | F23 | F24 | F25 | F26 | Field number                                |
| End of Word / (eok - \$) |    |    |    |    |    |       |     |     |     |     | End of word / key field                     |

**Creation of a node in a TRIE Tree using malloc() function.**

```
struct trienode *getnode()
```

```
{
```

```
    int i;
```

```
    struct trienode *temp;
```

```
    temp=(struct trienode*)(malloc(sizeof(struct trienode)));
```

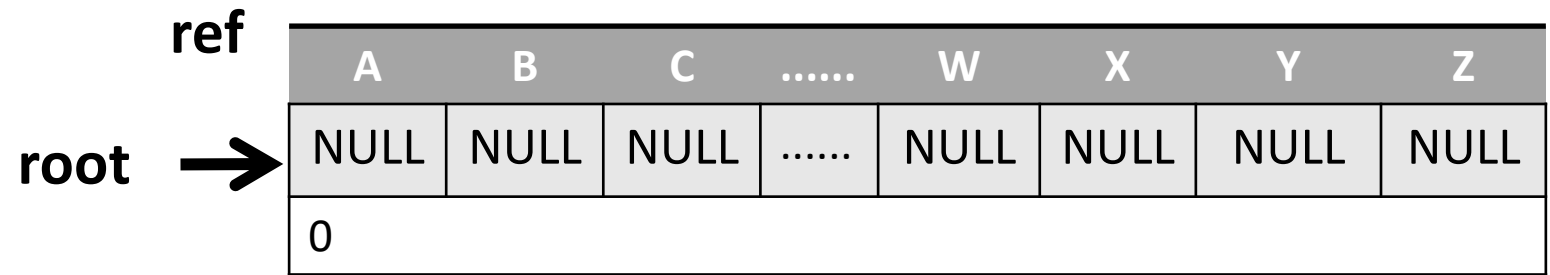

```
    for(i=0;i<26;i++)
```

```
        temp->child[i]=NULL;    // Initialize all the fields to NULL.
```

```
    temp->endofword=0;    // Initialize endofword to 0.
```

```
    return temp;
```

```
}
```

**root=getnode();**

### Insertion of a node in a TRIE Tree

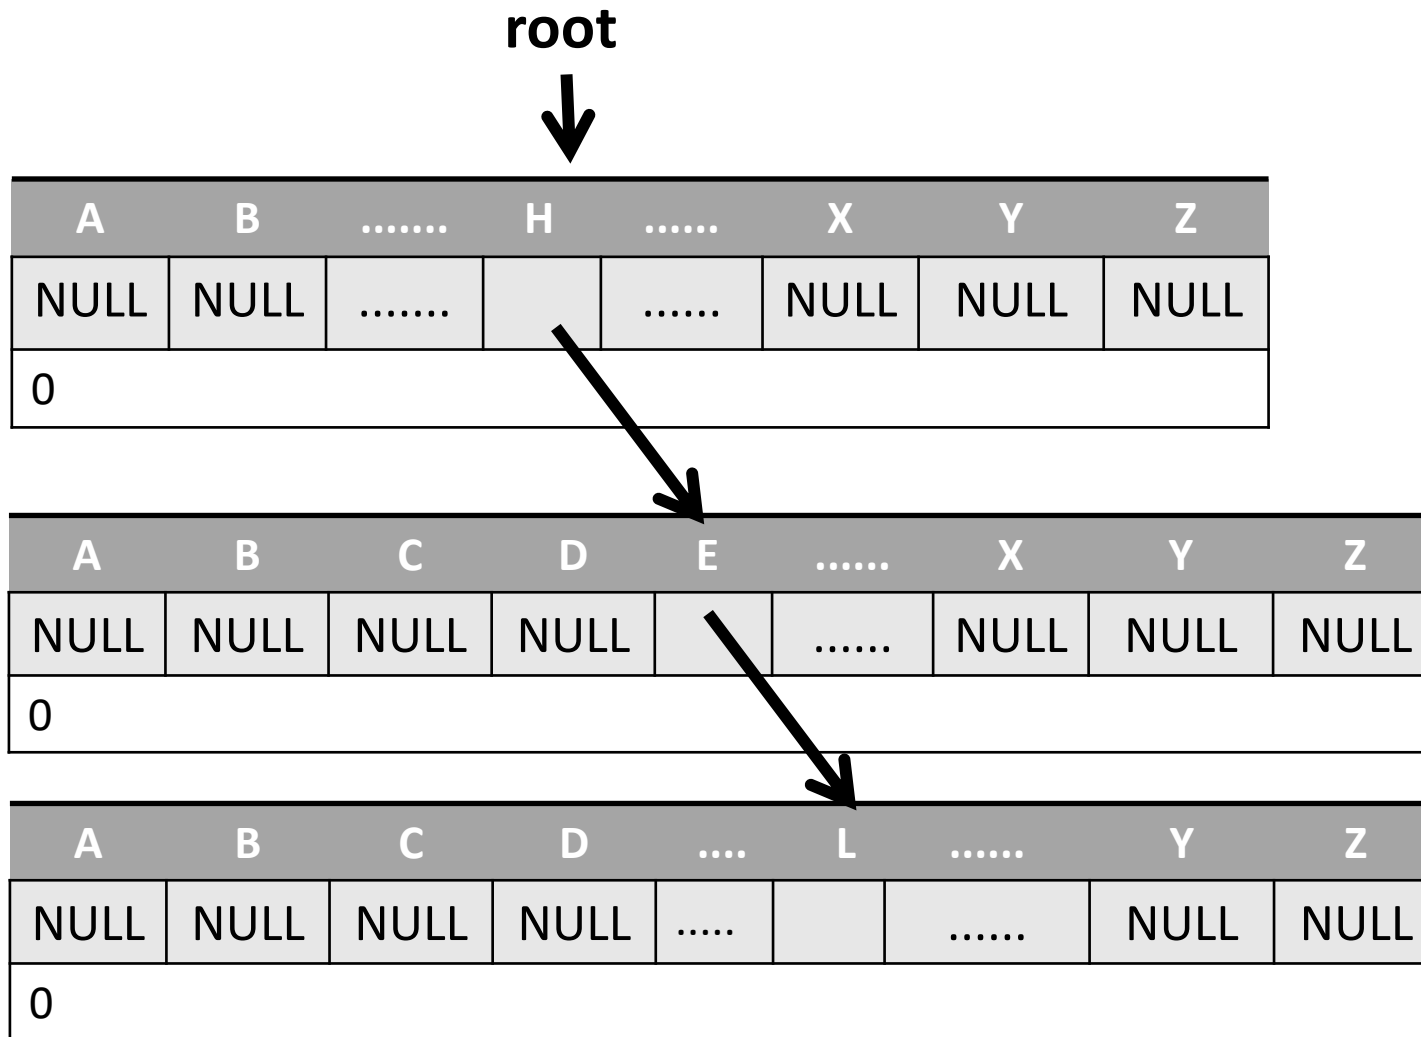

```
void insert(struct trienode *root, char *key)
{
    struct trienode *curr;
    int i,index;

    curr=root;
    for(i=0;key[i]!='\0';i++)
    {
        index=key[i]-'a';
        if(curr->child[index]==NULL)
            curr->child[index]=getnode();
        curr=curr->child[index];
    }
    curr->endofword=1;
}
```

```
insert(root,key);
```

| A    | B    | C    | D    | E | ..... | X    | Y    | Z    |
|------|------|------|------|---|-------|------|------|------|
| NULL | NULL | NULL | NULL |   | ..... | NULL | NULL | NULL |
| 0    |      |      |      |   |       |      |      |      |

**THANK YOU**
